Text Formatting

Normal paragraph text flows here. Lattice renders Markdown as **close to GitHub** as possible, so files look identical whether viewed in the editor preview, on GitHub, or printed.

Style	Syntax	Result
Bold	<code>**bold**</code>	bold
Italic	<code>*italic*</code>	<i>italic</i>
Bold + italic	<code>***both***</code>	<i>both</i>
Strikethrough	<code>~~strikethrough~~</code>	strikethrough
Inline code	<code>`code`</code>	<code>code</code>
Superscript	<code>X<sup>2</sup></code>	X ²
Subscript	<code>H<sub>2</sub>O</code>	H ₂ O

Note — sub/superscript: CommonMark/GFM has no native sub/superscript syntax. Lattice renders `<sup>` and `<sub>` HTML tags directly (GitHub and Obsidian do too). We recommend, though that you use alternatives that work everywhere: KaTeX math (`$X^2$` → X^2 , `$H_2O$` → H_2O) or Unicode characters (`x²` , `H₂O`). The linter flags these tags as a

portability hint — they may not render in all renderers.

Highlight Marks

Highlight marks are a Lattice-exclusive feature. Wrap any text in `==double equals==` to render it with a **bright amber background**.

This works in **any context** — inside a sentence, `==across italic and bold spans==`, or on its own line:

This entire sentence is highlighted.

[!NOTE] Highlight marks are **not** rendered inside code blocks or inline code — `==this stays raw==` .

Lists

Unordered

- First item
- Second item
 - Nested item A
 - Nested item B
 - Deeply nested
- Third item with **bold** and *italic* text

Ordered

1. Install Lattice from the [releases page](#)
2. Open any `.md` file — double-click or via **File → Open**
3. Choose your view:
 - i. **Edit** — raw CodeMirror editor only
 - ii. **Preview** — rendered HTML only
 - iii. **Dual** — side-by-side (four layout variants)
4. Print with `Ctrl/Cmd+P` — always renders to a clean light theme

Definition-style (using bold + indent)

Local-first All files stay on your machine. No cloud sync required.

Documents as Code Plain-text `.md` files are diff-friendly, version-controlled, and AI-ready.

Task Lists (GFM)

GitHub Flavored Markdown task lists render as interactive checkboxes in Lattice.

- ☒ Install Lattice
- ☒ Open the demo file
- ☒ Explore Edit / Preview / Dual views
- ☐ Try `Ctrl/Cmd+Shift+T` to regenerate the Table of Contents
- ☐ Try `Ctrl/Cmd+Shift+L` to auto-align a pipe table
- ☐ Paste a screenshot with `Ctrl/Cmd+V` — it auto-saves to a sibling folder
- ☒ Open a second file in a new window (multi-window support)
- ☐ Try printing to PDF with `Ctrl/Cmd+P`

Tables

Lattice supports **GFM pipe tables** with left, center, and right alignment. Press `Ctrl/Cmd+Shift+L` with the cursor anywhere in the table to auto-format it.

--	--	--	--

Print (Ctrl+P)	✓	✓	✓
Highlight marks	✓	✓	✓
Mermaid diagrams	—	✓	✓
KaTeX mathematics	—	✓	✓

Code

Inline code

Use backticks for `inline code`. Great for `file/paths`, `commands`, and `variable_names`.

Fenced code blocks

Lattice passes code fences to the preview unchanged — syntax highlighting is provided by the renderer.

```
// Lattice highlight-mark plugin – converts ==text== to <mark> elements
export const MARK_RE = /==(?:[^\n]|(?:!=))+?==/g;

export function splitAtMarks(text: string): HastNode[] {
  const parts: HastNode[] = [];
  let lastIndex = 0;
  MARK_RE.lastIndex = 0;
  let match: RegExpExecArray | null;
  while ((match = MARK_RE.exec(text)) !== null) {
    if (match.index > lastIndex)
      parts.push({ type: 'text', value: text.slice(lastIndex, match.index) });
    parts.push({
      type: 'element', tagName: 'mark',
      properties: {},
      children: [{ type: 'text', value: match[1] }],
    });
    lastIndex = match.index + match[0].length;
  }
  if (lastIndex < text.length)
    parts.push({ type: 'text', value: text.slice(lastIndex) });
  return parts;
}
```

```
// Tauri command – read file with conflict detection
#[tauri::command]
pub async fn read_file(path: String) -> Result<FileReadResult, String> {
  let content = fs::read_to_string(&path)
    .map_err(|e| format!("Cannot read {path}: {e}"))?;
  let hash = compute_sha256(&content);
  Ok(FileReadResult { content, hash })
}
```

```
# Build a production release
export LATTICEBUILD_NO="MyBuild-001"
npm run tauri build
```

Blockquotes

Single-level blockquote. Great for callouts, citations, or side notes.

Nested blockquotes are also supported:

GitHub-style Alerts (rendered by GitHub and Lattice)

- [!NOTE] Useful information that users should know, even when skimming.
- [!TIP] Optional advice for a better experience.
- [!IMPORTANT] Key information users need to know to achieve their goal.
- [!WARNING] Urgent information that needs immediate attention.
- [!CAUTION] Advises about risks or negative outcomes.

Mathematics — KaTeX

Lattice renders mathematics via **KaTeX**. Use `$...$` for inline and `$$...$$` for display math.

Inline math

Einstein's famous equation $E = mc^2$ and the quadratic formula $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ render inline.

The Euler identity $e^{i\pi} + 1 = 0$ is often called the most beautiful equation in mathematics.

Display math — Calculus

$$\int_{-\infty}^{\infty} e^{-x^2} dx = \sqrt{\pi}$$
$$\frac{d}{dx} \left[\int_a^{g(x)} f(t) dt \right] = f(g(x)) \cdot g'(x)$$

Display math — Linear Algebra

$$\mathbf{Ax} = \lambda \mathbf{x} \implies \det(\mathbf{A} - \lambda \mathbf{I}) = 0$$
$$\begin{pmatrix} a & b \\ c & d \end{pmatrix}^{-1} = \frac{1}{ad - bc} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

Display math — Series & Limits

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots$$
$$\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n = e$$

Mermaid Diagrams

Lattice renders ````mermaid```` fenced blocks inline in the preview.

HTML in Markdown

Lattice renders a **safe whitelist** of inline HTML tags and passes everything else through as literal text. The linter flags all inline HTML — whitelisted tags get a **hint** (portability risk), non-whitelisted tags get a **warning** (not rendered here).

HTML element	Lattice preview	GitHub	Portable alternative
<sup>	✓ rendered	✓	KaTeX: <code>\$X^2\$</code> → X^2 · Unicode: <code>X²</code>
<sub>	✓ rendered	✓	KaTeX: <code>\$H_2O\$</code> → H_2O · Unicode: <code>H₂O</code>
<kbd>	✓ rendered	✓	Inline code: <code>`Ctrl+S`</code>
 	✓ rendered	✓	Two trailing spaces or blank line
<mark>	⚠ plain text	✓	<code>==highlight==</code> (Lattice-native)
<details>	⚠ plain text	✓	Headings + TOC (no universal equivalent)
Other HTML	⚠ plain text	varies	Markdown equivalent (case-by-case)

Live examples of the whitelisted tags:

- Superscript: $X^2 + Y^3$
- Subscript: H_2O and CO_2
- Keyboard: press `Ctrl+S` to save
